Product : EPSILON CLOCK SAS-17E & SAS-36E

Recommended Software Upgrade - Version 1.43

Dear Valued Customer,

As a part of OROLIA ongoing commitment to superior product performance and reliability, we inform you that a new application software version is now available for EPSILON SAS-17E and SAS-36E products.

Description

The new version V1.43 is available on the support section of OROLIA WEB site. This new version improves SAS-E network security, including introduction of SNMP v3 support, and fixes some rare false alarm issue. While recommended, the update to v1.43 (from v1.26) is not mandatory.

Changes notifications

Binary version V1.43 for all SAS E units including the following improvements:

- Add the capability to enable or disable telnet as well as some non-secure network services: FTP, SNMP, HTTP and NTP – this includes a new “Network Service Setup” menu in “System Setup” webpage.
- Add SNMP V3 support, for secure SNMP operation

Corrected issues

- Occasional and fugitive occurrence of false “non urgent” alarm is fixed

Installation guide

You can download the new application software through the usual tools through the WEB pages of the unit. The operation is described in the user manual at the 4.1.8.3 Software and Firmware Upgrade chapter.

Known issues

Due to the implementation of SNMP v3 support, SNMP configuration may not be kept during upgrade from 1.26 to 1.43 release. It is then necessary to re-configure SNMP setup.

Production application date :

New built/delivered units will be delivered with version 1.43 in Q1 2022.
