WHITE RABBIT ZEN TP-FL

The fundamental standalone node

WHITE RABBIT ZEN TIME PROVIDER: WR-ZEN TP-FL

The fundamental standalone node that provides the White Rabbit features to a wide range of applications making use of its redundant connections.

The WR-ZEN TP-FL easily distributes time and frequency to other equipment by implementing widely available timing protocols: PTP, NTP, 10MHz/PPS.

The WR-ZEN TP-FL combines ultra-stable clocks with low jitter and temperature compensated clock resources to enhance its synchronization accuracy in a costeffective 1U form factor.

Optional expansion modules are available in order to provide additional configurable timing outputs, including 1PPS, 10MHz and IRIG signals, or/and enhanced holdover capability.

- Sub-nanosecond time accuracy and picosecond level precision
- WR, PTPv2 and NTP over optical interfaces
- Extended management and monitoring
- Distance range over 80km using fiber
- Multi-source time references
- Linux-based WRZ OS
- Failover mechanisms & Holdover
- Robusteness & Redundancy
- Configurable timing ouputs via expansion modules

Safran Electronics & Defense is with you every step of the way, building in the intelligence that gives you a critical advantage in observation, decision-making and guidance.

High Accuracy

The WR-ZEN TP-FL implements the White-Rabbit (WR) protocol, an high-accuracy extension of PTP based on SyncE, that allows to easily distribute sub-nanoseconds timing within Metro Area Network distances and beyond.
Worth to mention, that a timing network using WR protocol is not affected by the traffic load nor the number of hops.

Interoperability

Used as time provider or interoperability node, the WR-ZEN TP-FL can distribute standard PTP IEEE 1588-2008 for the last hop through its 2x fiber ports using the most common profiles such as Telecoms profiles (G.8265.1, G.8275.1) & Power profiles (IEEE C37.238-2011 and IEEE/IEC 61850-9-3). It also provides NTP interoperability and 10MHz/PPS distribution.

Resiliency

To ensure continuous operation the WR-ZEN TP-FL incorporates a failover mechanism. It provides a safer version of the "Best-Master-Clock" algorithm as it only allows switching over multiple (predetermined) timing sources when a failure is detected. Additionally, an optional Holdover oscillator can be included to maintain high accuracy (1.5us < 24h) even if all timing references are down.

Intuitive configuration

The new version of WRZ-OS introduces a complete web interface redesigned to provide an excellent user experience:
By the means of timing presets, a complex configuration can be done in a few clicks. Simultaneously, the CLI tool has also been rethought to allow straightforward configuration from the terminal to advanced users.

Advanced Management

The WR-ZEN TP devices enable extensive monitoring via REST-API and SNMP including the combination of smart alerts with traps. By providing templates, it facilitates its integration with third-party networking and monitoring tools. Moreover, it allows automatic topology discovery via LLDP and comprehensible remote logging through rsyslog.
.

Enhanced Security

TACACS+/RADIUS have been integrated to enable remote authentication for networked access control through a centralized server. The secure version of most of the protocols such as SFTP, HTTPS, SNMPv3 has been implemented and a firewall has been incorporated to provide a robust system against malicious users.
